THE PATENT WROUGHT IRON

Air-tight Gas Consuming Furnace,

WITH PERMANENT

WROUGHT IRON RADIATOR,

FOR BURNING

Anthracite and Bituminous Coal,

COKE OR WOOD,

MANUFACTURED BY

J. REYNOLDS & SON,

N. W. Cor. Thirteenth and Filbert Streets.

PHILADELPHIA, PA.

It has been thoroughly tested for many years and all the
various kinds of fuel burner in our country, in every department
of building, and in great numbers and increased attendance,
and we find that it will extend over all the very best
selected materials, & skilled workmen make no personal ap-
proach, and as expense whatever is good to make it not too
and simple to every aspect. It is a far superior to all other
Waste Air Burners in its construction and all the expense
it is better. Having produced this in comparison, therefore,
we do not only make known them, they are made of various sizes,
various & in every way is improved.

OBJECTIONS TO CAST IRON FURNACES.

It is the universal testimony of the leading scientific men of this Country and Europe, from the many practical tests and experiments they have made with Furnaces and Stoves constructed of the various materials used for the purpose, "That it is impossible to construct FURNACES OR STOVES of CAST IRON and secure total impermeability to the fatal gases generated, (carbonic oxide and carbonic acid) owing to its porosity or crystalline structure" and, "That these poisonous, health and life destroying gases can be securely held until safely conveyed to the smoke flue or chimney, by making the Furnaces of *wrought iron plates*, riveted together tightly as a *Steam Boiler*. For full account of these interesting experiments, see "Anthracite and Health," by Dr. Geo. Derby, Boston, Mass.; "Notes on Experiments on the Permeability of Cast Iron by Gases," by Gen. Morin, Paris; "London Philosophical Magazine," vol. 22, 1866; "Appleton's Journal," vol. 3, No. 53; "Boston Journal of Chemistry," vol. 4, No. 10; "Scientific American," 1871; and other authorities.

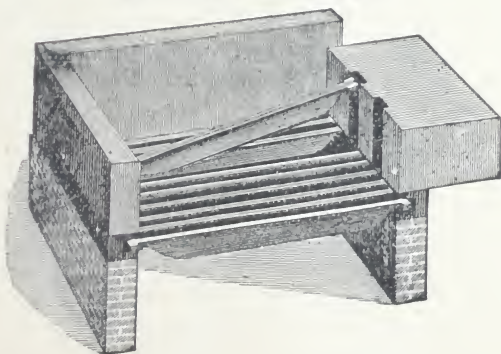

"Furnaces should not be made in part of *cast iron* and in part of *wrought iron*, as the different crystalline structure of these metals creates energetic galvanic currents, and where the two join, oxidation goes on so rapidly, assisted by the deposits of ashes about the joints becoming moist when the furnace is not in use, that the whole is quickly destroyed."

ALL CAST IRON FURNACES are necessarily made in pieces, the joints being cemented with putty, or similar material; some are made with grooves in which the different parts rest; these grooves being filled with sand or cement, the constant expansion, contraction and changes of heat invariably warp these pieces, loosen the fittings, the cement falls out, and large openings are thereby made for the escape of GAS, DUST and SMOKE into the air chamber; no fastenings yet devised are sufficient to keep these pieces from separating by the expansion and contraction of the metals, nothing can resist this power. When the damper in Smoke Pipe of Furnace is partially or wholly closed to regulate the draft, especially when the fire is fixed for the night, the escape of gas through these openings or joints, is very largely increased, making them very objectionable and dangerous; these are incontrovertible facts.

CONSTRUCTION OF OUR WROUGHT IRON FURNACES.

The large illustration gives a general idea of the appearance of our Furnace and aids us in the explanation of its construction. It is made of the very best quality of WROUGHT IRON PLATES (those nearest the fire being $\frac{1}{4}$ inch thick) riveted together as tightly as those of a *steam boiler*, so that it is practically of one piece; dispensing entirely with all SAND, CEMENT, OR PUTTY JOINTS, the only safe and sure method of preventing the escape of GAS, DUST AND SMOKE into the Air Chamber. *Wrought iron* being an elastic material will bend before breaking, and riveted together in this manner will expand and contract in the mass without disturbing the seams. The main part or top of the Furnace, is strongly bolted down upon wrought iron side plates which enclose the tile or lining of Fire Pot and extending down into the brickwork of the Ash Pit; or, if preferred upon a Wrought Iron Bottom or Ash Pit.

SECTION OF FIRE POT.

THE FIRE POT is oblong square and shallow; it is formed by four heavy, well burned clay tile or linings four inches thick, one for each side. Owing to its shape it can be easily kept clean and free from clinkers or any obstruction, by simply passing the poker against the sides and removing them daily. This cannot be done with any round fire Fire Pot, which soon fills up and requires constant relining. On the top of these tile are placed perforated hollow plates, forming air chambers from which air which is previously heated in its passage around the Fire Pot, is dis-

charged in jets over the fire, commingling with the gases and smoke from the fuel, causing them to ignite and burn; adding much to the heat produced.

THE GRATE is made of separate bars, any one of which can be removed and replaced without disturbing the others. The two centre ones are wrought iron draw bars, and when necessary to clean the fire pot, are drawn out, allowing the contents to fall into the ash pit; the rests or bearing bars are placed under the front and back tile, and the ends of the grate bars inserted therein, (as shown in cut of fire pot;) this prevents any obstruction to the draft reaching every portion of the fire pot, giving at all times, a bright glowing fire in every part of it, and making it a very easy matter to readily clean it of all ashes.

THE RADIATING SURFACE of our furnace is largely increased by our PATENT PERMANENT WROUGHT IRON RADIATOR. It is also made of heavy wrought iron plates well riveted together, and is internally divided, so that the products of combustion in passing from the furnace through it, have to pass first down, then up, then down, and then up, before reaching the smoke flue; it supersedes the use of, and avoids all the objections (leakage of gas and smoke, rising out, and constant repairing), to, the old style of pipes or drums formerly used in this, and now generally in very many other furnaces. The PATENT RADIATOR can be cleaned from the outside of furnace through the clean out doors provided for the purpose, by any person, at any time, without disturbing the fire or any part of furnace.

THE FURNACE IS REGULATED easily and perfectly without the use of dampers or valves, by the BRASS SLIDE in the ROUND AIR-TIGHT DRAFT DOOR, opening it to increase the draft and heat, and closing it to reduce the same. The round air tight draft door is an essential and specially important feature of the furnace, and as designed and made by us is not to be found on any other except as a poor imitation. The beveled edge on the door and counterpart of the frame are turned and ground, making a perfectly air-tight joint; the brass slide is planed and nicely fitted, the beveled edge on door and frame, in conjunction with the peculiar construction of the latch, avoids the breaking of the frame by the more rapid expansion of the door, at the same time keeping it always air-tight. The upper or feed door of the furnace is always

kept closed, except when supplying with fuel; thus no currents of cold air are allowed to pass in over the fire, thereby cooling and very sensibly reducing the temperature of the radiating surfaces, as is the case with all furnaces that require the opening of the upper or feed door to regulate or check draft and fire. By our plan of regulating by the slide in air-tight draft door, and keeping the feed door closed, the draft is under perfect control, and the temperature of radiating surfaces kept uniform; when the fire is fixed for the night, the temperature of the house is not reduced more than three or four degrees, ensuring the great and enjoyable comfort of a warm house continuously. During the late Spring and early Fall months, when little heat is required, in the morning and evening, a small fire can be made and (by the air-tight door) so regulated as to allow those apartments most distant from the furnace to be moderately warm, without any more oppression at those in close proximity; or, *wood* can be burned at these times.

The greatest heat and economy can only be obtained by the exercise of some care in the management of the furnace, and strictly complying with the few simple directions for its control, especially in the reference to its attention. The fire pot (when burning anthracite coal) should be raked clean and clear of all ashes every morning, and filled up with coal to the top of the side tile or linings, and no higher, except in the middle; the draft door should then be left open until the coal is thoroughly ignited to a bright red heat, when it must be closed, and furnace regulated by brass slide, or THE AUTOMATIC HEAT AND DRAFT REGULATOR (a description of which is given on another page). No more coal should be put on before night time unless absolutely necessary, which is seldom; the fire need not be let go out once during a whole Winter season. By its peculiar construction it does not get red hot in any part, but generates a soft, genial, Summer-like heat, in no way the least injurious.

DUST.

One of the greatest annoyances found in all kinds of Heating Apparatus, is that arising from the Dust when raking the ashes from the fire pot. Being dry and hot, it is scattered around the cellar and drawn into the cold air openings, entering the apart-

ments through the registers. To overcome this various plans have been adopted, the most common being the ordinary dust flue, which connects the ash pit with smoke flue, and has a damper to open or close it as required. If after done raking, this damper should be left open by the forgetfulness of the servant (and it most generally is), the draft is through the fire downwards out through the dust flue, burning and destroying the grate. This dust flue becomes filled with ashes, the damper rusts off, and requires much time and frequent expense to keep in order.

THE PATENT DUST SCREEN attached to our furnace is a perfect remedy for all these defects and difficulties. It is simply a box door opened at the bottom, placed on the left hand side of the feed door of furnace, and long enough to cover the opening of the upper and part of that of the lower or draft door. When the fire wants raking, the doors are opened, and the Dust Screen is shut over their openings, forming a flue from the ash pit up over the fire through the upper door for the escape of the dust which is invariably drawn into it by the draft of the flue; the doors of the furnace cannot be shut, until this screen is put back in its proper position.

All these improvements in our furnace are secured by LETTERS PATENT. It is offered as a complete and desirable HEATING APPARATUS in every respect; and if proper care be given it, it will last a life time and cost but little to keep in repair; all furnaces sold by us are put up by experienced workmen furnished by us, and guaranteed to give satisfaction, thereby relieving the purchaser of all risk should they fail.

STEAM AND HOT AIR.

Great efforts are constantly made against WARM AIR FURNACES and in favor of STEAM FOR HEATING PURPOSES, asserting that the heat from Steam Heaters is more moist and healthy than that from Warm Air Furnaces, etc., which is not true as, "Iron heated to any possible point attained in Hot Air Furnaces has no power to abstract moisture from the air. Theory and practice in this respect are in perfect accord. Each confirms the other." Buildings specially arranged for drying cotton, cloth, wool, lumber and other materials are usually heated by *Steam pipes*. The air from a Steam Heater is generally oppressive, produces discomfort, and

lacks vitality on account of its intensity. When the Radiators or Coils are placed in the apartments there is no circulation, as the air in them is heated by direct contact with them; when they are placed in the cellar under the hot air flues, the steam often condenses before it reaches those flues farthest from the boiler, making it necessary to keep up large fires and heavy pressure to obtain the required heat in those apartments during cold weather.

Other disadvantages in the use of steam for heating purposes, are: the expense in erecting and maintaining the apparatus, the time required to raise the water to the boiling point and fill the Radiators with steam, the difficulty of obtaining moderate heat in mild weather, and the necessity of watchfulness to avoid the possibility of the water freezing in the supply pipe and boiler bursting them, should the fire, by accident or carelessness, go out during severe winter weather: this accident has frequently happened with much damage.

In the use of steam for any purpose there is always more or less danger, as pressure, no matter how small, implies force, and, with the ability to produce force, the possibility of explosion, as safety valves and similar devices are not always reliable, especially when left to the care and management of unskilled, inexperienced or careless servants, a fact too often proved.

PATENT

WROUGHT IRON AIR-TIGHT GAS CONSUMING FURNACE

FOR BURNING

BITUMINOUS COAL OR COKE.

5 SIZES.

A WARM AIR HEATING APPARATUS, specially and perfectly adapted to the economical and satisfactory burning of BITUMINOUS or WESTERN COAL and COKE, and in which all kinds of fuel can be used, one equally as well as the other without

changing any part of it, is our WROUGHT IRON AIR-TIGHT GAS CONSUMING FURNACE. It is without any doubt the only one in which this can be, and is done with universal success and satisfaction, it is unhesitatingly recommended, from the severe tests made with it, as the only approved and reliable SOFT COAL HOUSE WARMING FURNACE in this country.

The great disadvantages in ALL CAST IRON and other FURNACES for burning this description of fuel, are their imperfect construction, the frequent attention required to keep them supplied and replenished with coal, the filling up of the pipes and flues readily and continuously with soot and dirt, the great difficulty experienced in cleaning them properly, the inevitable cracking and burning out of the Fire Pot and parts exposed to the direct action of the fire, constant provoking and disagreeable annoyance from the Smoke, Gas, and Dust escaping from the many joints, cracks and openings into the air chamber and being dispersed over the entire house, and their frequent liability to expensive repairs, if not entire renewal. These are all overcome and entirely obviated in our Furnace, it is guaranteed to be absolutely free from any one of them or any other objections to Furnaces for burning soft coal, and is warranted to give satisfaction.

It is exactly similar in construction to our Furnace for burning Anthracite Coal, except that it is made of heavier iron well stayed and braced with angle irons to prevent the possibility of its warping. It is made wider above the fire, the fire pot is deeper and of sufficient capacity to hold, under ordinary circumstances, fuel for one day's consumption; the clay tile linings of the fire pot are wider at the top than at the grate, and so shaped as to cause the flames to be directed towards the center of fire pot instead of against the sides of the Furnace. The chambers for heating the air for the combustion of the Smoke and Gases and the perforations for admitting it in jets over the fire, are made in the clay tile. It can be thoroughly cleaned at any time without annoyance or disturbing the fire, by either scraping out the soot or setting it on fire and burning it out; sufficient convenient openings for the purpose being provided.

There not being any dampers in our Furnace, the flue is unobstructed and a free exit is given to the unconsumed products of combustion. The fire and heat is kept under perfect control by

the BRASS SLIDE in the AIR-TIGHT DRAFT-DOOR. The commonest WESTERN or BITUMINOUS COAL, Slack, Coke, and in fact anything used as fuel can be burned in it. Being specially made for Soft Coal there is not the slightest difficulty in burning either Hard Coal or Wood in it at any time, no change of any part being necessary. We are satisfied we cannot say too much in its favor, and refer with great pleasure to the testimonials received from well known parties in the Soft Coal region, who are using them, and who give undoubted evidence of their great efficiency and value.

PATENT

WROUGHT IRON FURNACE

WITH PERMANENT WROUGHT IRON RADIATOR

FOR BURNING

WOOD AND STUMPS.

We also make a first Class Wrought Iron Furnace for setting in brick-work, particularly adapted to the burning of wood and stumps; it has doors sufficiently large to admit wood without splitting, thereby avoiding frequent and constant replenishing; it is provided with the Patent Permanent Radiator, Evaporator, and all conveniences for cleaning it; it is the most durable, efficient and economical Wood furnace in the market, and guaranteed to give perfect satisfaction.

1776

THE PATENTED

1876

CENTENNIAL WROUGHT-IRON FURNACE

FOR BURNING

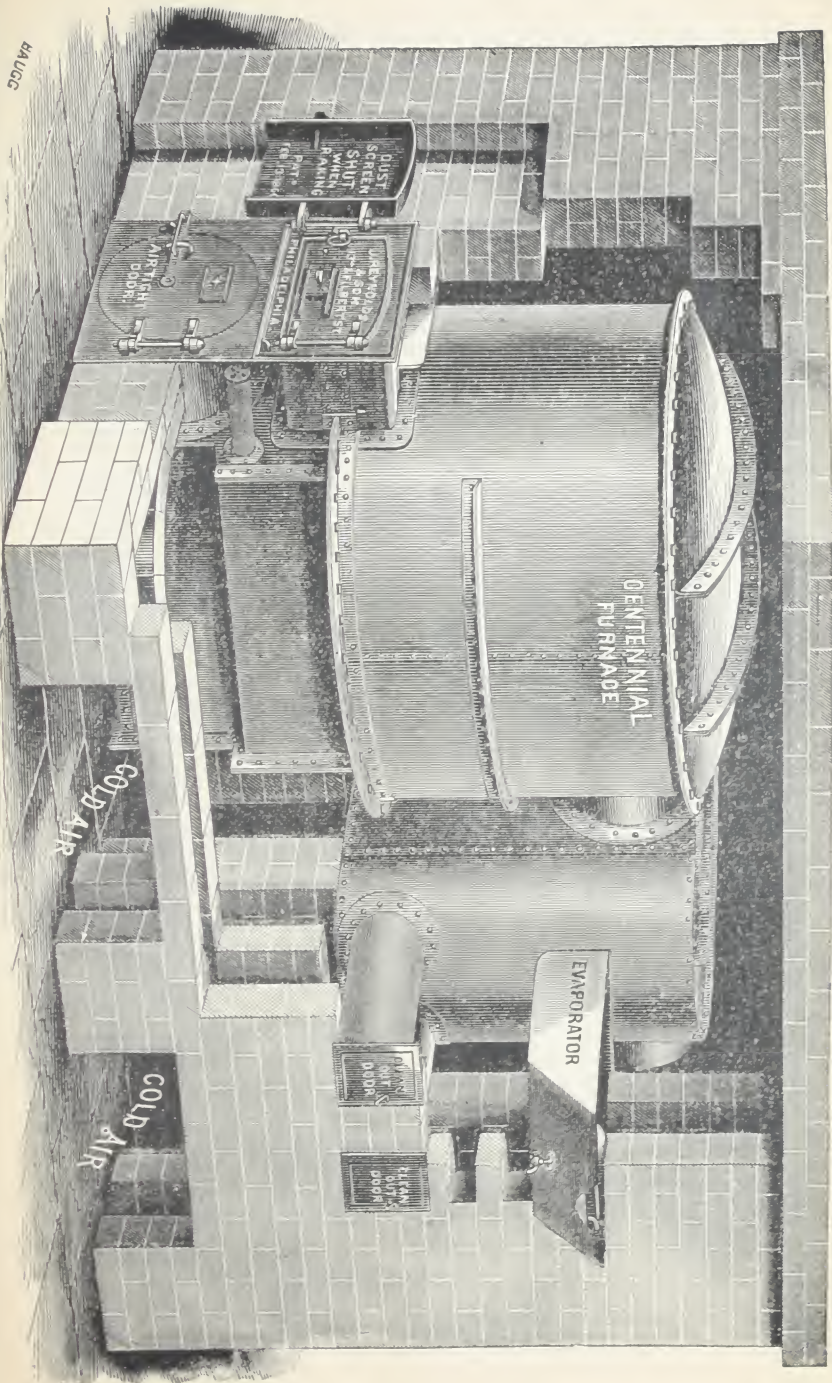

BITUMINOUS COAL OR COKE,

THREE SIZES FOR BRICK-WORK.

This Furnace is specially designed for and adapted to the Warming of Public Buildings, Halls, Churches, and extra large Private Residences, where a very great amount of heat is required, and Bituminous Coal or Coke exclusively used for fuel.

After a long practical experience and most careful investigation with Bituminous Coal, becoming acquainted with the destructive effects of the intense heat generated by it on all kinds of Heating Apparatus, we have not spared any expense, labor, or materials whatever in the construction of the Centennial Furnace. It has all the improvements suggested by our extensive experience, as well as that of those who have been using this kind of fuel. We offer it not as a cheap ordinary affair, but as a perfect Heating Apparatus in every respect, believing it to be as efficient, durable, and indestructible as any Furnace can be made, with the confidence that it will stand any liberal test to which it can be submitted without the least damaging result.

It is oval in shape, with a rectangular shape Fire-Pot, and oval Radiator (see illustration).

SECTIONAL CUT SHOWING INTERNAL CONSTRUCTION OF CENTENNIAL FURNACE.

It is constructed of the very best heavy Charcoal Bloom iron plates, carefully and securely riveted together, the top is concave and made of three pieces of iron, with raised flanges riveted through these flanges, insuring great strength and an impossibility to warp or injure it.

The sides and back above the Fire-Pot and the Collar connecting furnace with the Radiator are lined with fire-clay tiling, as an extra precaution to prevent warping and damage by the flames or intense heat generated. The Fire-Pot is made similar to that of our other Furnaces; the clay tile are much heavier and larger, ample provision being made for the combustion of the Gas and Smoke. The Grate is made of separate Bars easily removed for repair when required.

The Radiator attached to the furnace is oval in shape, has all the latest improvements, is internally divided with four partitions, causing the products of combustion to impinge on the largest amount of surface, and has an oval opening through the centre for the passage of cold air, thereby increasing the available radiating surface, and generating a larger amount of heat than any other device for the purpose. It is a permanent fixture, and can be cleaned at any time without removing, or disturbing the fire.

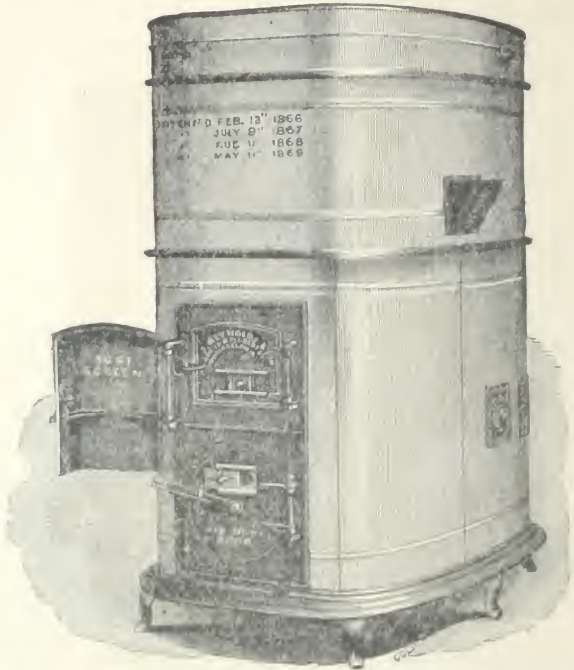

The Centennial is regulated and controlled in the same manner as our other Furnaces, by the air-tight door with brass slide, and has all the facilities for cleaning.

The linings or any part becoming damaged by use, can be easily replaced by any mechanic without the least difficulty or taking apart.

The entire Furnace is composed of only three parts. Top or Body, Ash-pit, and Radiator, all of wrought iron. The Body is securely bolted to the Ash-pit, and with the Radiator properly adjusted, the apparatus is practically and to all purposes one part or piece, making it absolutely Gas, Dust, and Smoke tight, and not in the least affected by expansion or contraction.

It is easily set up in brick-work by any first-class bricklayer, with the instructions given him. It requires a large and abundant supply of cold air well distributed to all parts. When set up by bricklayers furnished by us we guarantee them to give satisfaction.

THE PATENTED
**WROUGHT IRON AIR-TIGHT GAS CONSUM-
 ING PORTABLE FURNACE.**

FOR BURNING ANTHRACITE AND BITUMINOUS COAL, COKE OR WOOD.

For a long time we have experienced the necessity of manufacturing a Portable Furnace similar to the one we make for setting in brickwork, and now offer to those in want of a perfectly reliable, durable and economical apparatus, the best Wrought Iron Air-Tight Gas Consuming Portable Furnace ever made in this country.

It is not a cheap or inferior article, but being of the best materials and workmanship, and to supply the increasing demand for a first class Portable Furnace the price must be accordingly; if ordinary care is taken with it, it will cost very little if anything

for repairs, to say nothing of the economy in its use in which it is not equaled by any other Heating Apparatus.

In its construction, it is in every particular, exactly like our Celebrated Furnace for setting in brickwork, with the addition of a Wrought Iron Ash Pit or Bottom; the whole structure is made of the very best quality of heavy iron well riveted together. (See cut of Furnace without casing.)

FURNACE WITH CASING REMOVED.

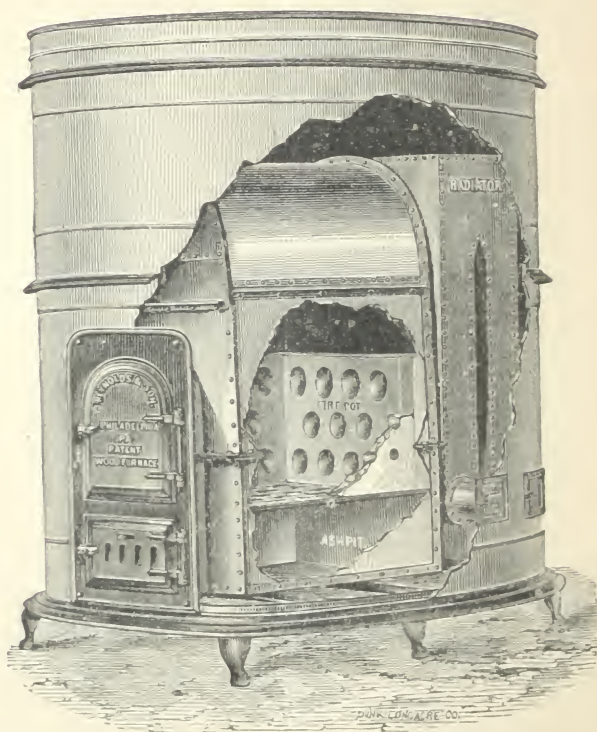

It is regulated and controlled by the Brass Slide in Air-Tight Draft Door, or by the Automatic Heat and Draft Regulator.

For warming dwellings and places in which Portable Furnaces answer the purpose, they have no equals. Anthracite or Bituminous Coal, Coke or Wood can be burned in it without changing any part of it. We also make three sizes specially for burning BITUMINOUS or WESTERN COAL, which have the same peculiarities in construction as the Furnace for setting in brickwork.

They are furnished with EVAPORATORS and PERMANENT WROUGHT IRON RADIATORS, and enclosed in either GALVANIZED or RUSSIA IRON CASES.

THE PATENT

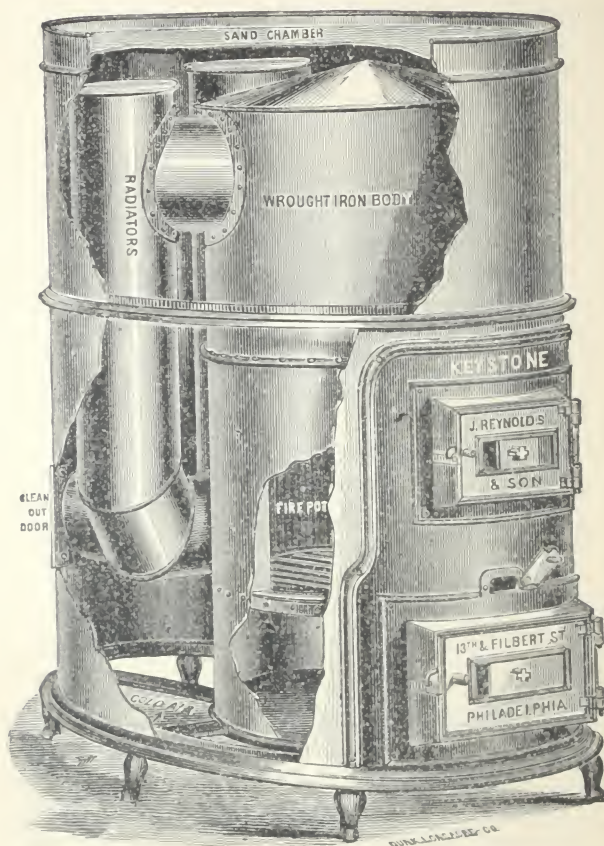

WROUGHT IRON PORTABLE WOOD FURNACE.

We are now manufacturing a WROUGHT IRON PORTABLE FURNACE for burning wood exclusively, and from the extra care taken and quality of materials used in its construction, we confidently assert, that it is without any exception whatever, the most sub-

stantial, durable, efficient and economical Portable Wood Furnace ever placed before the public. The cut gives an accurate idea of the manner in which it is made, the same style of workmanship is found in this as in our other furnaces. It is made of heavy wrought iron, well and substantially riveted together. The wood is burned on an open plate or grate. It has an ash pit below the grate, and is lined with heavy clay tile in which are numerous perforations, so shaped that they allow the heat to strike the plates surrounding the fire pot, at the same time preventing their becoming filled with ashes, which cannot lodge in them. The Radiating Surface is increased and the heat economized by the permanent Wrought Iron Radiator. This furnace heats up quickly, requires little attention, economizes fuel, can be cleaned easily without disturbing it, needs no repairing, and if properly taken care of, will last a life time. It has an Evaporator and is enclosed in either a Galvanized or Russia Iron Casing.

KEYSTONE PORTABLE FURNACE.

BODY 24 INCHES DIAMETER.

GRATE 18 INCHES DIAMETER.

FOR BURNING ANTHRACITE OR BITUMINOUS COAL AND COKE.

To supply the demand for a First Class Portable Furnace at a moderate price, we are now offering our KEYSTONE PORTABLE FURNACE. It is made of No. 14 Best Bloom iron, well riveted and seamed together. No cast iron being used in its construction, except for the Doors and Grate; it has two permanent 9 inch Drums,

fectly reliable, and besides maintaining a uniform and even temperature in the house, is very economical, saving fuel, the coal does not clinker and melt, but the combustible portions of it are all consumed.

It is furnished with our furnace, to those who desire it, for a small extra charge in comparison to its many valuable and decided advantages, and can be attached to any furnace or Heating Apparatus.

CONSTRUCTION OF FLUES.

Too much care and attention cannot be given to the proper construction of Flues for either Smoke or Hot Air. Many a FURNACE HAS BEEN CONDEMNED, PRONOUNCED A FAILURE, and continual trouble given to, and expense incurred by, the maker, when the entire fault and difficulty was in the very careless and imperfect manner in which the flues were built. It often seems that those having them in charge, suppose that any flue will answer the purpose no matter how small, crooked, or badly finished, so that it is built in some place that does not interfere with the symmetry or appearance of the apartments. Smoke and hot air flues should be at least 9x13 inches in the clear; smaller ones to be used only as a case of necessity. Smoke flues if possible should be topped out above the highest point of the roof to prevent the currents of air being driven down them, and otherwise impeding the draft. All flues should be uniform in size, well and smoothly pargeted with good strong mortar; the smoke flue should be so carefully separated from the hot air flues as to always prevent the possibility of an opening from one to the other. Whenever practicable hot air flues should be built in the inner walls and located as near each other and the heating apparatus as possible, to avoid long hot air pipes through the cellar. These matters should receive personal attention as the building progresses, and not be left to the judgment of indifferent workmen, as any attention given to the flues is well repaid by the economy and comfort in heating a house. We will cheerfully give our personal attention to the locating of flues, and give proper directions for their construction.

VENTILATION.

So much has been written and said on this subject, that we intend only to state a few facts and give our advice in reference

to Ventilation as it relates to the heating, comfort and healthy condition of our Dwellings. It is certainly an undisputed fact, that a well heated house is more comfortable and healthy, in proportion to its being well Ventilated. What we desire, is an active circulation of pure warm air through the different apartments and a free and unobstructed exit for all that becomes impure. Hot air as it enters the rooms through the Registers immediately ascends towards the ceiling, and with more or less rapidity, as it is more or less heated. Cold and foul air is found at the floor, or below the breathing line. Now if an opening be provided in a flue near the floor for the escape of this cold or foul air, the hot air as it continuously enters and rises forces the cold air out, creating at once a circulation; various methods have been adopted for accelerating and increasing this circulation, among the most approved and successful of which, are: That of having Open Grate Fires or open Fire places in as many of the rooms as possible, or by making the Smoke flues for Heating Apparatus and Range, larger than usual, and putting in them a Cast iron or Terra Cotta Pipe for the Smoke, using the space around it for a ventilating Shaft, or flue, the pipe becomes very hot by the passage of the Smoke and Gas through it, and by being thus heated creates a very strong draft upwards in the flue around it, in all rooms through which these flues pass, openings can be made in them for Ventilation, at the floor or just above the Wash board, those rooms not adjacent to the flues, can have openings made in the floor, and carried between the joists to them, the pipes should be well stayed and extend up to the top of the chimney, no openings need be made into them near the ceiling, as they would let the hot air escape, should a room become too hot, close the hot air Register and open a door, never open a window, especially in a School House, Church or Public Hall, until all other means of cool them off have been exhausted, as this allows the hot air to escape and the cold to rush rapidly in. If either of the above plans are adopted and carefully followed the complete ventilation of the building will be successfully accomplished. No house should now be built without some provision being made to ventilate it. We will at any time properly locate ventilating flues in buildings or on the plans and give any information necessary.

COOKING APPARATUS

FOR

HOTELS, RESTAURANTS,

Public Institutions and Private Dwellings,

FOR BURNING

Anthracite and Bituminous Coal

OR WOOD.

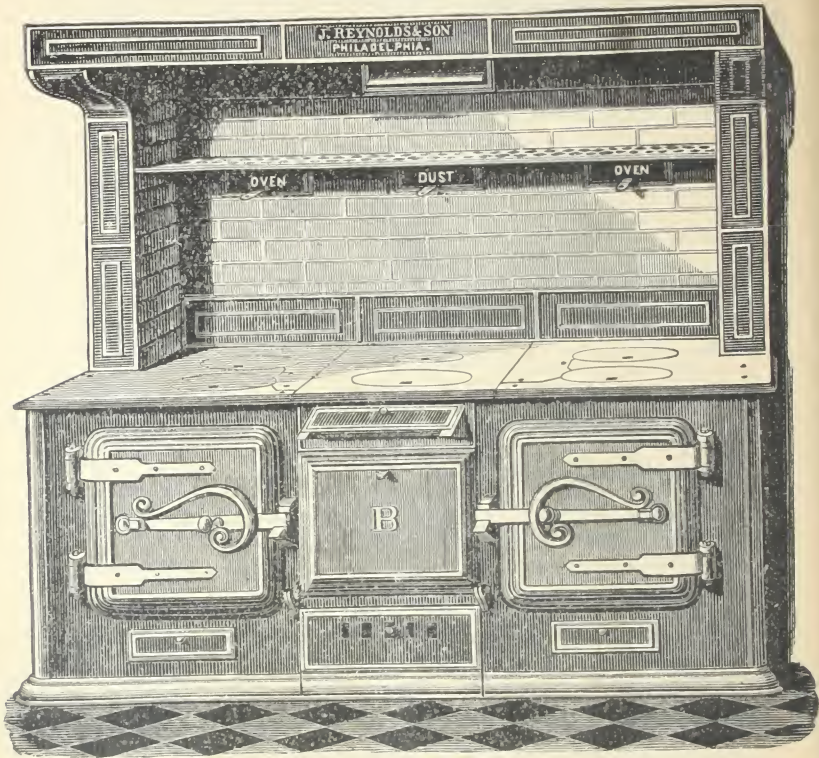

KITCHENERS, FRENCH RANGES, OYSTER RANGES, HEATING RANGES,
FRENCH BROILERS, CARVING TABLES, CAKE GRIDDLES,
IMPERIAL URNS AND KITCHEN FURNITURE
GENERALLY.

We are manufacturing and have for sale all the variety of COOKING APPARATUS of the most approved kind, combining the modern improvements required by the different styles of cooking. Our Ranges are made of Heavy Castings and great care taken in their construction and general appearance. They are put up by experienced workmen and guaranteed to give satisfaction.

The fitting up of FIRST CLASS KITCHENS a specialty, to which we give our personal attention.

Estimates and plans will be furnished for Cooking Apparatus of any description.

B. KITCHENER.

Plain Black Front or Polished. For Wood or Coal.

Length of Range 5 ft. 9 inches. Grate 16 inches.

Two Ovens, each 16 inches high, 16 inches wide and 24 inches deep.

This Range is the heaviest, most substantial and elegant in its general appearance now offered for sale in this city. It is finished with great care, and designed for First Class Private Kitchens, or Small Hotels and Restaurants; it has large Ovens, Plate Rack and Grate adapted for roasting in front; it can be set up with Water Back and Copper Tubes for Circulating Boiler, or with Back Log Boiler, and to heat one or more rooms over it, if so desired.

Price \$	Water Back and Copper Tubes, \$
Polished Front \$	extra.

C. KITCHENER.

Plain Black or Polished Front.

Length of Range 4 feet 9 inches. Grate 14 inches.

Two Ovens, each 13 inches high, 13 inches wide and 22 inches deep.

This Range is exactly similar in design and construction to the B. KITCHENER and finished and mounted in the same substantial manner.

Price \$

Water Back and Copper Tubes \$

Polished Front \$

extra.

SMALL DOUBLE OVEN FAMILY RANGE

TWO SIZES.

Length 4 ft. 3 inches and 4 ft. 5 inches. Grates 14 and 16 inches.

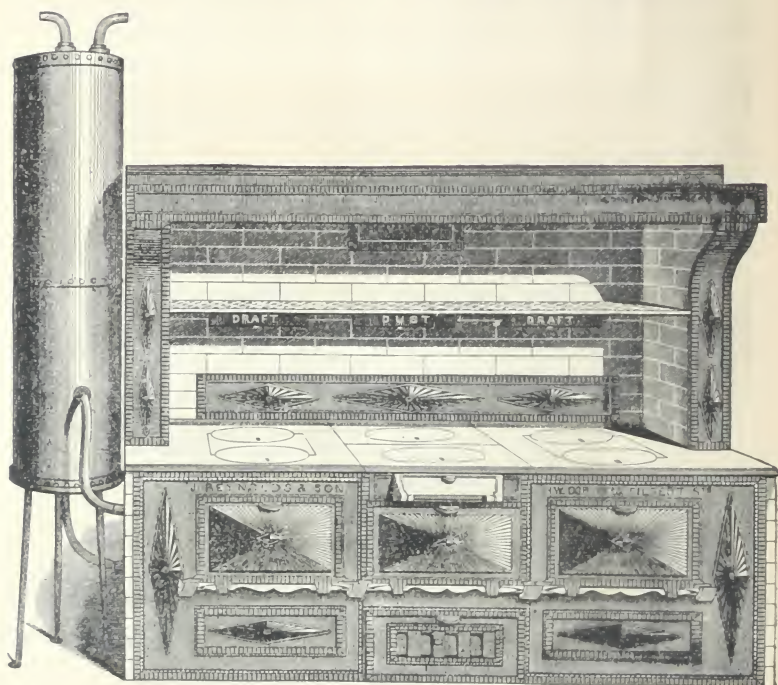

2 Ovens each 13 inches high 13 inches wide and 22 inches deep.

This Range has been in use for a number of years, and has given to every case perfect satisfaction. It will do all the cooking required by a family of 12 persons, it is made of heavy castings well finished and put together. It has been and will continue to be a favorite among housekeepers. It has a roasting grate and plate-rack and set up with either Water back and Copper tubes or Green's Patent Boilers or with Back Log Boiler.

Price \$

Water Back and Copper Tubes, \$

LARGE DOUBLE OVEN FAMILY RANGE.

TWO SIZES FOR WOOD OR COAL.

Length of Range 5 ft. 3 in. and 5 ft. 5. Grates 14 and 16 in.

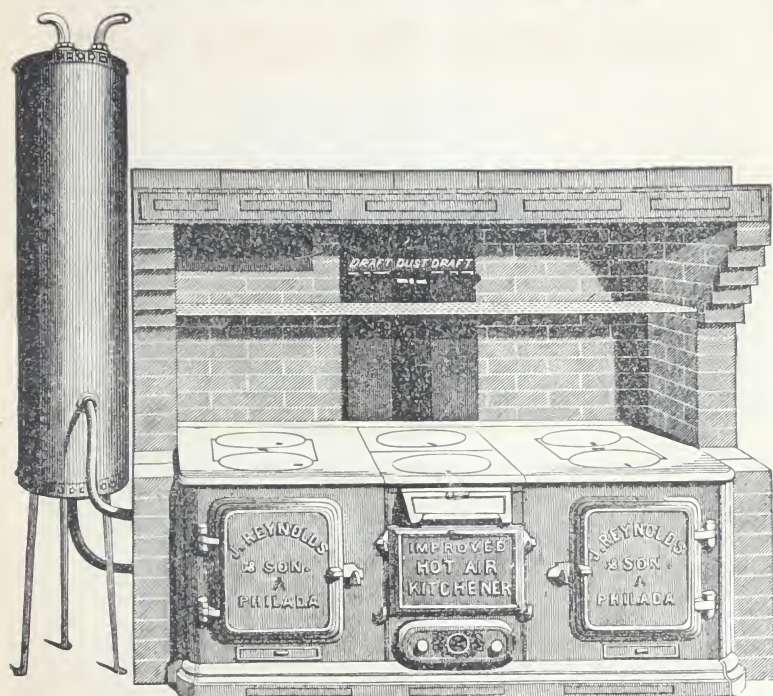

Two Ovens each 10½ inches high, 14½ inches wide, and 22 inches deep.

This is one of our oldest and well tried Ranges which has given universal satisfaction; the castings are very heavy and well finished, it has a large top surface, Grate adapted to Roasting or Broiling in front, and plate rack. It is furnished either with Water Back and Copper Tubes for Circulating Boiler or Back Log Boiler and warranted to give perfect satisfaction.

Price \$

Water Back and Copper Tubes \$

IMPROVED HOT AIR KITCHENER.

WITH BLACK OR POLISHED FRONTS.

2 Sizes.

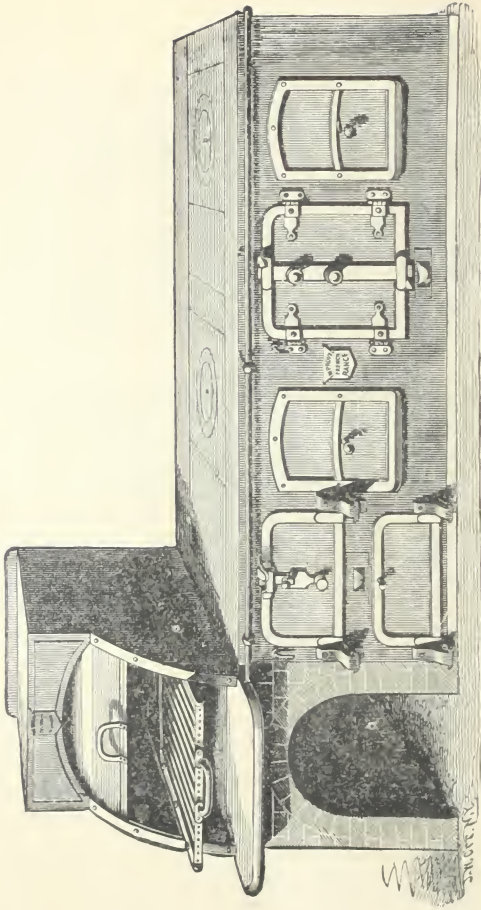

Length of Range 4 feet 3 inches and 4 ft. 5 inches, Grates 14 and 16 inches.

This cut represents our Patented Flat top Heating and Cooking RANGE. The Castings are made heavy and mounted with care, it has Grate adapted to Roasting and Broiling, in front, and plate rack, and will heat satisfactory one or more rooms over it, without requiring additional fuel, the surplus or wasted heat of the Range being utilized without interfering with its baking or cooking, no odors from the cooking pass up with the heated air, it is set up with either Circulating or Back Log boilers.

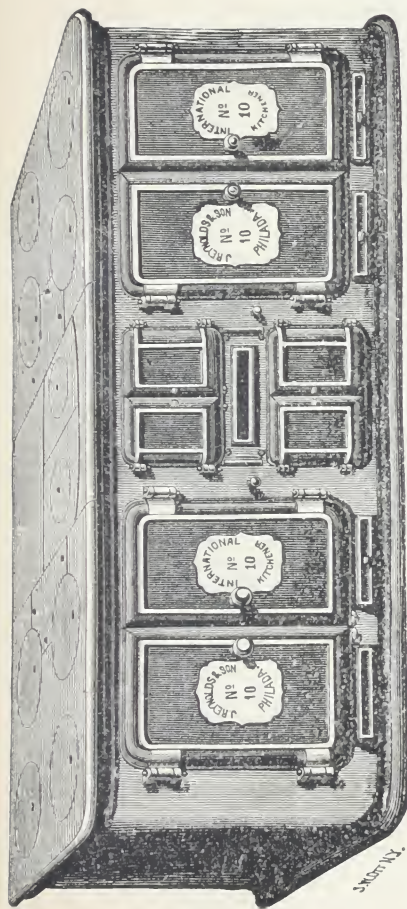

Price \$ Water Back and Copper Tubes \$

hot air fixture \$.

FRENCH RANGES AND BROILERS.

The FRENCH RANGE is acknowledged to be the best, most substantial and efficient Cooking Apparatus for large Hotels and Restaurants, and has decided advantages. It can be made of any size, to suit any Kitchen, and the arrangement of the Fires and Ovens to suit the purchaser. The cut represents the 7 feet Range and 26 inch Broiler. The Broilers can be set at either end of the Range or are sold and set up separately. Catalogue of sizes with prices furnished to those desiring them.

THE ABOVE CUT REPRESENTS OUR

No. 10 INTERNATIONAL KITCHENER.

6 ft. 4 in. long, 30 in. wide, with two ovens, each 20 in. high, 22 in. wide and 28 in. deep.

It will do the Cooking for 100 to 150 persons, is one of the most substantial Ranges of its class now manufactured, and very desirable for small Restaurants and Hotels.

It has a Water Back or Patent Water Top and will heat a large quantity of Water and a Carving Table with the same fire. It is made for either wood or coal, and requires very little brickwork to set it.

Price \$ Water Back or Water Top and Tubes \$

IRON HEATER.

(NO. 2 HEATS 32 IRONS.)

These heaters are made expressly for LAUNDRIES, HOTELS, and PUBLIC INSTITUTIONS, they are heavy and durable, and of different sizes to heat from 9 or 100 irons. Single or double coils of Pipe can be attached for Heating from 50 to 300 gallons of water.

LAUNDRIES

Furnished With COPPER KETTLES, set in brickwork, for wood and coal, SOAPSTONE or SLATE WASH TUBS, and all other appliances.

LOW DOWN AND ELEVATED GRATES.

LOW DOWN GRATE.

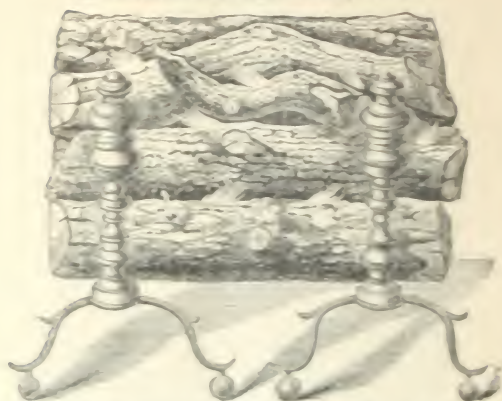

REGISTERED FOR WORLD'S EXHIBITION.

We have on hand and make to order Low Down and Elevated GRATES of elegant finish and design, round or elliptical fronts in BLACK-PAINTED, IRON-GREEN, POLISHED, SILVER-PLATED, BRASS, GOLD-PLATE, GERMAN SILVER, &c. to suit any size opening in Mantels or Fire Places.

GAS LOGS.

(Patented June 6th, 1871.)

The above cut represents the "FRENCH GAS LOG," or imitation of wood fire.

The sticks of the Log are formed and colored to resemble hickory wood, and have fixed between them at different places splints of asbestos, which become incandescent when in use; so that, when gas is turned on, a match applied, the hundreds of small gas jets ignited and combined, the Log gives a close imitation of a hickory wood fire.

A good, cheerful fire is ever ready by simply turning on and lighting the gas, the flow of which is regulated with the same ease and appliance of the ordinary gas burner. It makes no dust, dirt, or ashes, and ventilates the room effectually.

The cost of burning, with gas at the rate of \$3 per thousand feet, turned on at full bend, is from 8 to 15 cents per hour, accord- ing to size of Log. With private gas machines, a Log can be run for from 5 to 10 cents per hour.

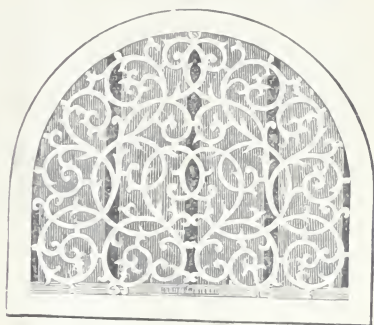

They are generally used in open fire-places, placed on andirons, either of the old style in brass, or of new and handsome designs and finish in steel, bronze or gilt. They can also be used in the low-down or half low-down grates, and the situation is, perhaps, more complete in them than on andirons, as the absence of ashes is not noticed, and these flat-bottomed grates are now much used for wood.

Registers and Ventilators.

SQUARE REGISTER.

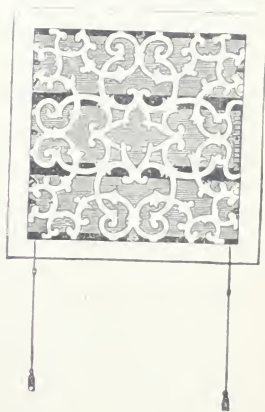

CIRCLING TOP REGISTER.

ROUND REGISTER.

SQUARE VENTILATOR.

We have a large assortment of HOT AIR REGISTERS AND VENTILATORS of neat designs and various sizes in BLACK JAPANNED, GOLD BRONZED, ELECTRO-COPPER BRONZED, NICKLE PLATED, WHITE PORCELAIN ENAMELED and PLAIN WHITE JAPANNED.

Also, ORNAMENTED PEDESTAL REGISTERS and SCREENS for COILS and STEAM PIPES.

Conservatories, Green Houses and Graperies
